Optimisation des processus de chargement et de transport du phosphate (French Edition) Mammar Rim

Les processus de chargement et de transport revêtent une grande importance dans une mine à ciel ouvert, étant donné que les dépenses liées à ces deux processus peuvent absorber jusqu'à 70% du budget. Dans le cadre de l'optimisation de l'extraction dans la mine de Benguerir, le but de ce travail est d'optimiser les processus de chargement et de transport de phosphate, en vue de saturer l'épierrage et d'étudier le projet du criblage mobile. En effet, le problème d'insaturation de l'épierrage génère à la fois un déficit de production et des pertes en coût. Pour ce faire, une application de la Méthode de Résolution de Problème (MRP) a été menée. Le développement de la méthode a permis de définir le problème et des actions et contre-mesures. Ainsi, l'éloignement des panneaux en cours d'exploitation a nécessité l'étude de l'option du criblage mobile. La MRP, a montré une atteinte des objectifs de l'épierrage sur les deux chaînes de l'installation et une réduction de la consommation en énergie de l'installation d'épierrage de 75% pour la chaîne 2. L'acquisition du criblage mobile au panneau 5 diminuerait le prix unitaire de criblage et de transport du phosphate de 30Dhs/THC à 25Dhs/THC.
